

SUPPLEMENTARY FIGURE. Proportion of SARS-CoV-2 specimens sequenced* and proportion of Delta and Omicron variants among sequenced SARS-CoV-2 specimens — Los Angeles County, California, November 13, 2021–January 8, 2022

*The percentage of SARS-CoV-2 specimens sequenced by week is subject to a data lag because of processing time and reporting lags from laboratories. Data from the most recent weeks are incomplete and subject to change as more results are sent to Los Angeles County Department of Public Health through genomic surveillance activities. Additionally, whole genome sequencing capacity is limited and the proportion of cases with sequencing results is expected to decrease as the number of cases increases.
